

## # Program Slicing

↳ Extract an executable subset of a program that potentially affects that value at a particular program location.

↳ Slicing Criterion  $\Rightarrow$  Program location + Variable.

Ex:-

1  $n = \text{int}(\text{input}("Enter a number"))$

2  $i = 1$

3  $\text{sum} = 0$

4  $\text{prod} = 1$

5 while  $i \leq n :$

6      $\text{sum} += i$

7      $\text{prod} *= i$

8      $i += 1$

9  $\text{print}(\text{sum})$      Slice for value of sum

10  $\text{print}(\text{prod})$      at this statement.

# Backward  $\Rightarrow$  Statements that influence the Slicing criterion

# Forward = " " are " " by the Slicing criterion.

- Application  Debugging
-  program understanding
-  change impact analysis
-  parallelization.

18

## Program Dependence Graph

It is directed graph representing data & control dependences.

$E \Rightarrow$  Data flow dependences)

Control " "

$N \Rightarrow$  Statements.

Variable Definition & Variable Use

"

"

A VD for a variable  $v$  is  
a BB that assigns  
to  $v$

A VU for a variable  
 $v$  is a BB that  
reads the value of  $v$

### Definition - Clear Paths

A DCP for a variable  $v$  is a path  $n_1 \dots n_k$   
in the CFG such that

$n_1$  is variable definition for  $v$   
 $n_k$  " variable use for  $v$

### Definition - Use pair (DU pair)

• It is a variable  $U$  is a pair of nodes  $(d, u)$   
such that there is a definition path  $d \dots u$  in  
CFG.

## Data flow Dependencias

DCf \ USE	1	2	3	4	5	6	7	8	9	10

6						*		*	*	*
7						*		*	*	*
8						*		*	*	*
9										*
10										

# Control Flow Dependencies

## ■ Post-dominator:

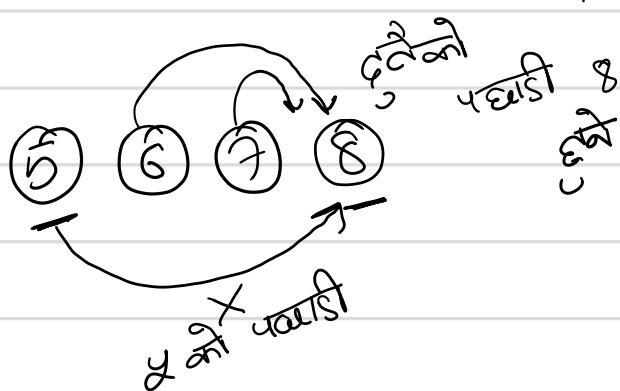

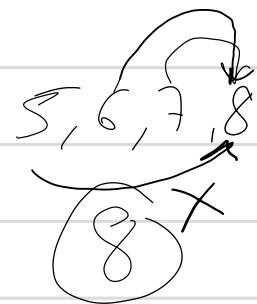

Node  $n_2$  (strictly) post-dominates node  $n_1 (\neq n_2)$  if every path  $n_1, \dots, \text{exit}$  in the control flow graph contains  $n_2$

## ■ Control dependence:

Node  $n_2$  is control-dependent on node  $n_1 \neq n_2$  if

- there exists a control flow path  $P = n_1, \dots, n_2$  where  $n_2$  post-dominates any node in  $P$  (excluding  $n_1$ ), and
- $n_2$  does not post-dominate  $n_1$

8

7 is 1 " 5  
~~18~~ 11 1 " 11 5

# Computing Slices

Given:

- Program dependence graph  $G_{PD}$
- Slicing criterion  $(n, V)$ , where  $n$  is a statement and  $V$  is the set of variables defined or used at  $n$

Slice for  $(n, V)$ :

All statements from which  $n$  is **reachable**

(i.e., all statements on which  $n$  depends)

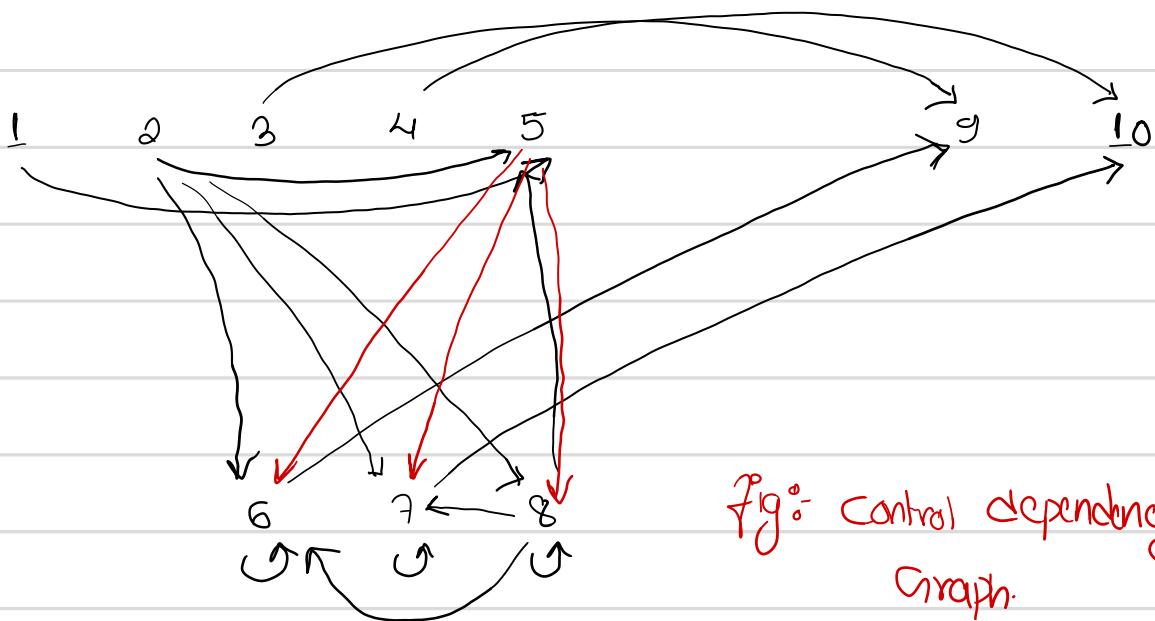

Fig: Control dependency graph.

→ Data dependency.

→ Control dependency

$\text{Slice}(9, \{\text{sum}\})$

$\rightarrow \{n \mid \text{reachable}(n, 9)\}$

$\rightarrow \{1, 2, 3, 5, 6, 8, 9\}$

```

var x = 1;           // 1
var y = 2;           // 2
if (x < y) {        // 3
    y = x;             // 4
}
var z = x;           // 5

```

**Draw the PDG and compute  $\text{slice}(5, \{z\})$ .**

**What is the sum of**

- **the number of nodes,**
- **the number of edges, and**
- **the number of statements in the slice?**

(#) Symbolic Execution :-

↳ White box (looking into program).

↳ Reasons about behaviour of program by "executing" it with Symbolic values.

Ex:-

```

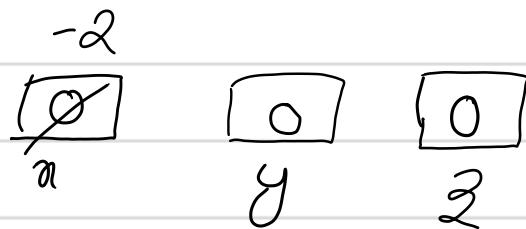

def fun(a, b, c):
    n = y = z = 0
    if a:
        a = -2
    if b > 5:
        if a & c:
            y = 1
            z = 2
    assert n + y + z != 3

```

## Concrete Execution

$$a = b = c = 1.$$

$$\text{anser} \quad -2 + 0 + 0 \neq 3 \quad \text{X}$$

Pulled.

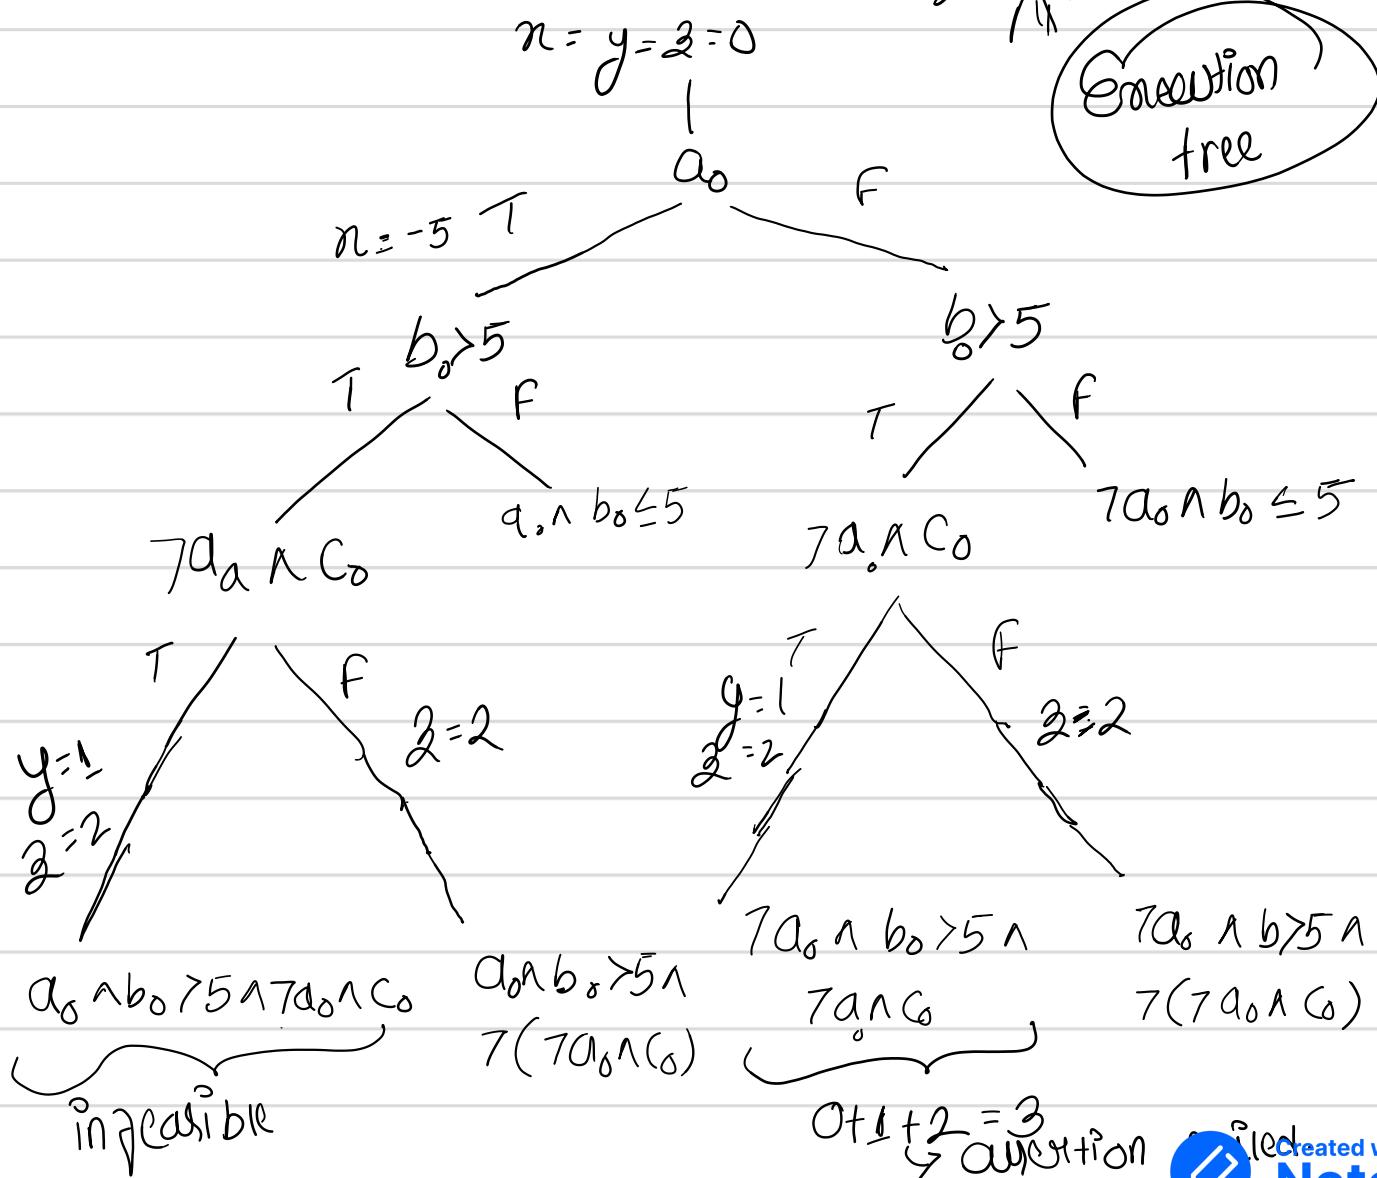

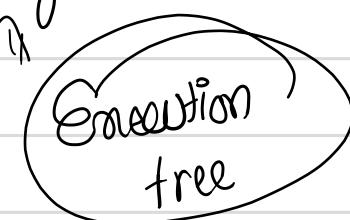

## Symbolic Execution

$$a = a_0, \quad b = b_0, \quad c = c_0 \quad \begin{matrix} \leftarrow \\ \text{Initial values} \end{matrix}$$

$\sim$  Symbolic values

$n = y = z = 0$

binary tree

## #1 Dynamic Program Analysis.

- a) Information flow analysis
- b) Dynamic Program Slicing.
- c) Test generation
- d) Path profiling.

### a) Information Flow Analysis:

↳ Secure the data manipulated by a Computing System.

→ Confidentiality & Integrity.

→ Check whether information from one Code location propagates to another location.

Example:

\* Trusted

Possible?

Confidentiality

untrusted

trusted  
information

\* Trusted

Possible  
Integrity.

## Ex) Confidentiality

CreditCard = 5678

$n = \text{CreditCard}$

visible = False

if  $n > 1000$ :

visible = True

secret information propagates to  $n$

↑ Secret information (partly)  
propagates to visible.

## Ex) Integrity

designatedPresident = "Ram"

$n = \text{input}()$

designatedPresident =  $n$

at low-integrity info  
propagates to high-integrity.

## Lattice of Security levels

High

Top Secret

low

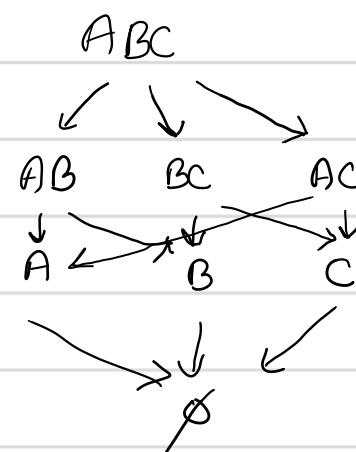

Secret

Confidential

Public

## Universally Bounded lattice

Tuple  $(S, \rightarrow, \perp, T, \oplus, \otimes)$

Set of Security Classes  
Partial order  
least upper bound  
greatest lower bound

$$S \rightarrow \{ABC, AB, AC, BC, A, B, C, \emptyset\}$$

$\rightarrow$  partial order (more secret to less secret)

$$\perp \rightarrow \text{lower bound} \rightarrow \emptyset$$

$$T \rightarrow \text{upper bound} \rightarrow ABC$$

$$\oplus \rightarrow \text{least upper bound operator} \rightarrow \text{Combine, Union}$$

$$\otimes \rightarrow \text{greatest lower bound} \rightarrow \text{Intersection}$$

$$AB \oplus A = AB$$

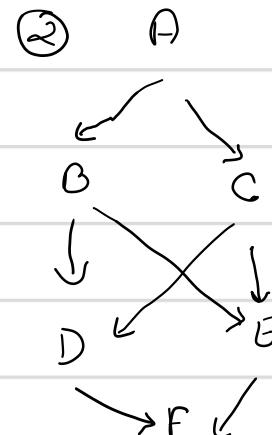

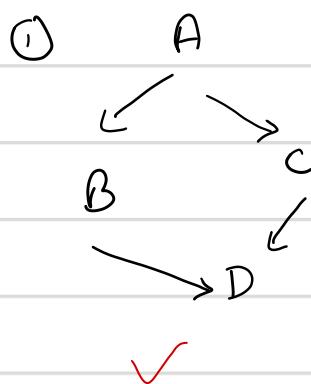

$$ABC \otimes C = C$$

$$\emptyset \oplus AC = AC$$

✓

✓

Q. Is the following U.B.L?

$$D \oplus E = ?$$

$$= \{A, B, C\}$$

$\Rightarrow$  no least upper bound

## information flow Policy :-

④ No information flow from source to sink.

Explicit flow  $\Rightarrow$  caused by data flow dependency  
Implicit " " " " control "

$n = \text{CreditCardNb}$

↑  
Explicit flow.

if  $n > 1000$ :

↑ Implicit flow

## Dynamic information flow analysis

- Associate security labels with memory locations.
- Propagate labels at runtime.

### Taint Source & Sinks

Possible Source  $\Rightarrow$  Variables, return values

Possible Sinks  $\Rightarrow$  Variables, parameters.

## Taint Propagation :-

### ① Explicit flows.

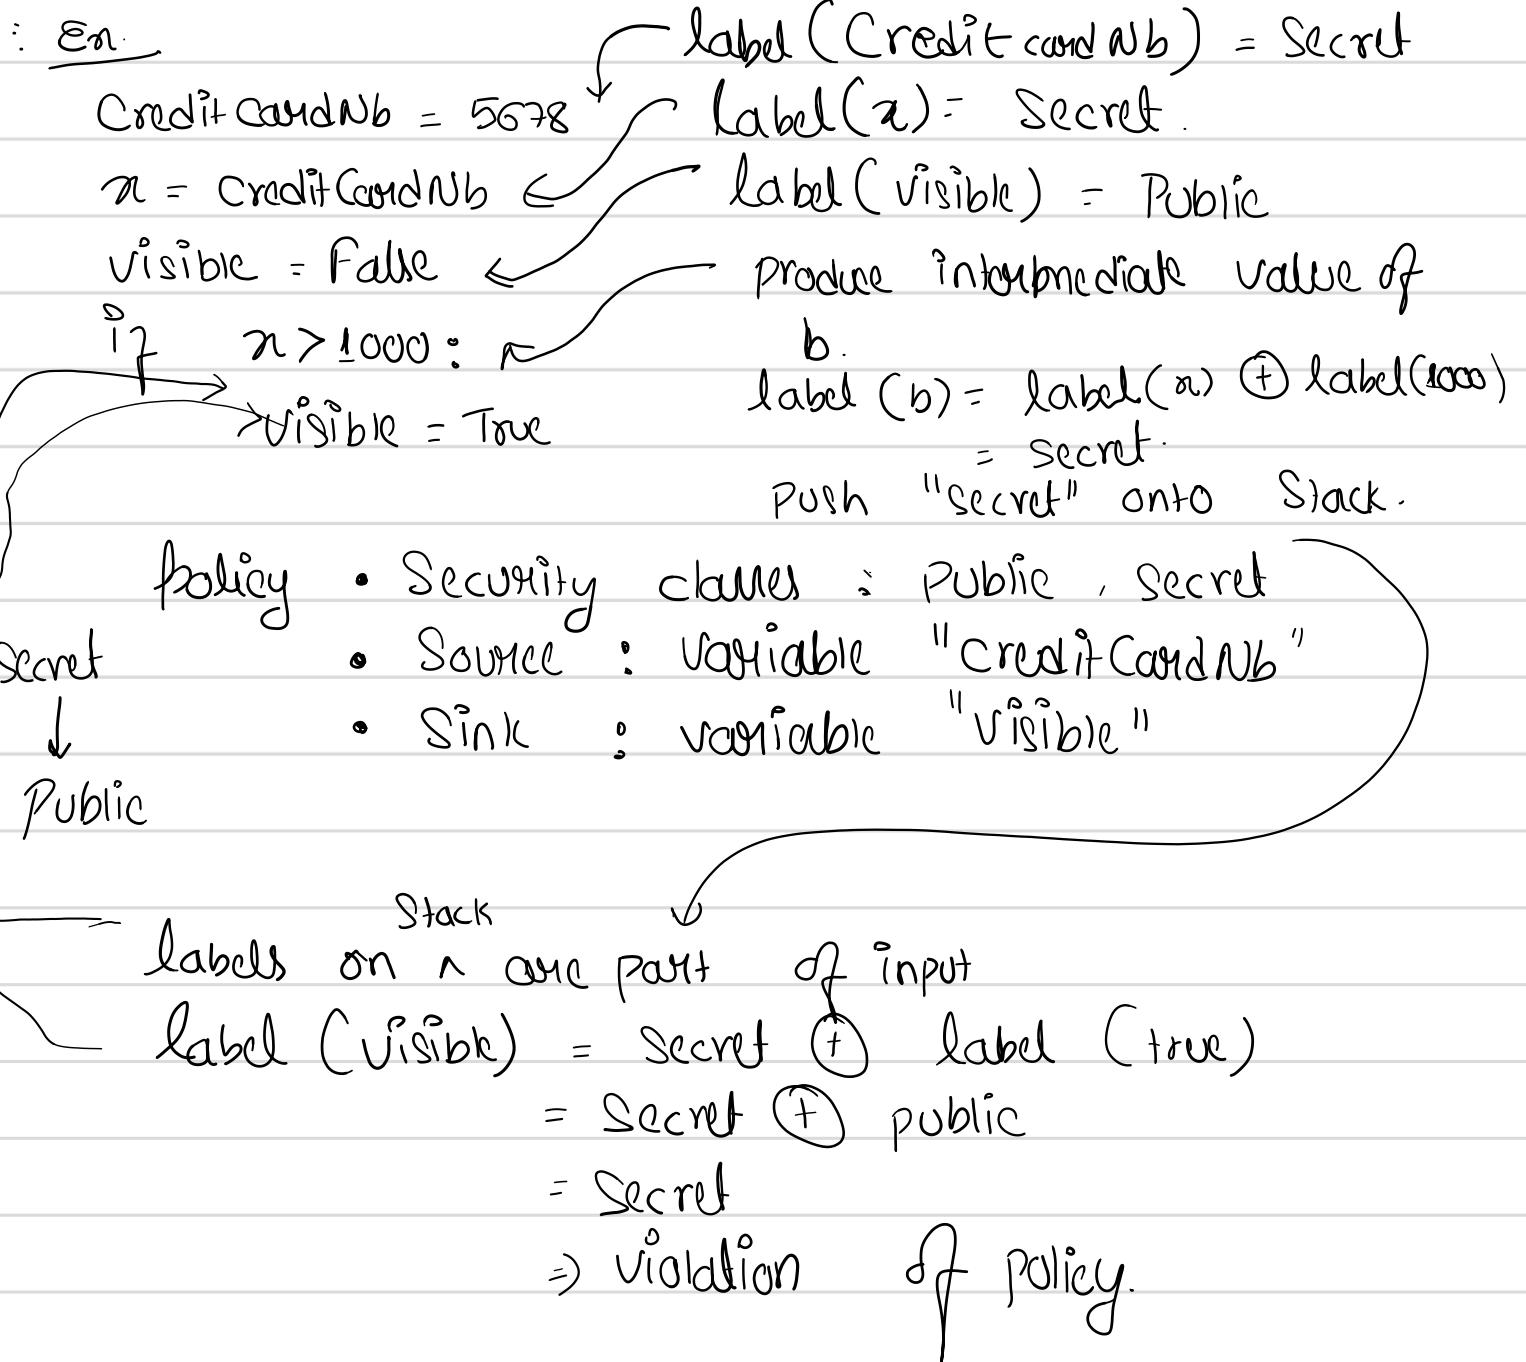

$\text{label(result)} \leftarrow \text{label}(\text{inp}_1) \uparrow \dots \uparrow \text{label}(\text{inp}_z)$

### ② Implicit flows.

maintains stack.

push the label.

$n = \text{getx}()$  ①

$y = x + 5$  ②

$z = \text{True}$  ③

$\text{if } x == 10: \quad \text{④}$

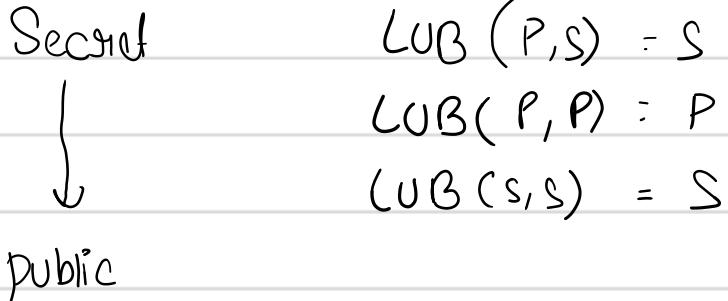

$z = \text{False}$  ⑤

$\text{foo}(z)$  ⑥

Suppose that getx returns 5.  
 write down the labels after  
 each operation. Is there a  
 policy violation.  
 Policy  $\rightarrow$  Security classes  
 Public & Secret.

# Security lattice

$$\text{label}(x) = \text{Secret} \quad \textcircled{1}$$

$$\begin{aligned}\text{label}(y) &= \text{label}(x) \oplus \text{label}(5) \quad \textcircled{2} \\ &= \text{Secret} \oplus \text{public} \\ &= \text{Secret}\end{aligned}$$

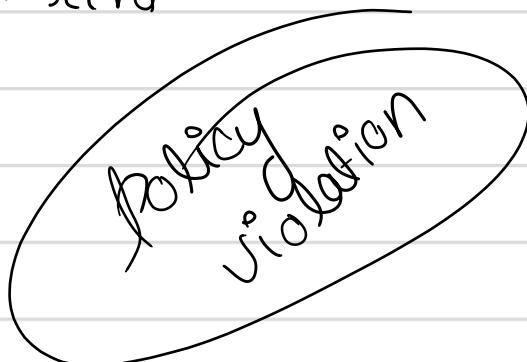

$$\text{label}(z) = \text{label}(\text{true}) = \text{public} \quad \textcircled{3}$$

$$\begin{aligned}\text{label}(b) &= \text{label}(x) \oplus \text{label}(\text{!}0) \quad \textcircled{4} \\ &= \text{Secret} \oplus \text{public} \\ &= \text{Secret}\end{aligned}$$

push Secret to Stack.

$$\begin{aligned}\text{label}(z) &= \text{label}(\text{false}) \oplus \text{secret} \quad \textcircled{5} \\ &= \text{Public} \oplus \text{secret} \\ &= \text{secret}\end{aligned}$$

$$\text{label}(z) = \text{secret} \quad \textcircled{6}$$

## Dynamic Slicing

↳ Statements of an execution that must be executed to give a variable a particular value.

↳ Slice from one IP different from slice of another IP.

a) Execution history.  $\rightarrow$  Sequence of PDG.

b) Slice for statement  $n$  & variable  $v$ :

```
1 n = input()
2 if n < 0:
3     y = n+1
4     z = n+2
```

else:

```
5     if n == 0:
6         y = n+3
7         z = n+4
8 else:
```

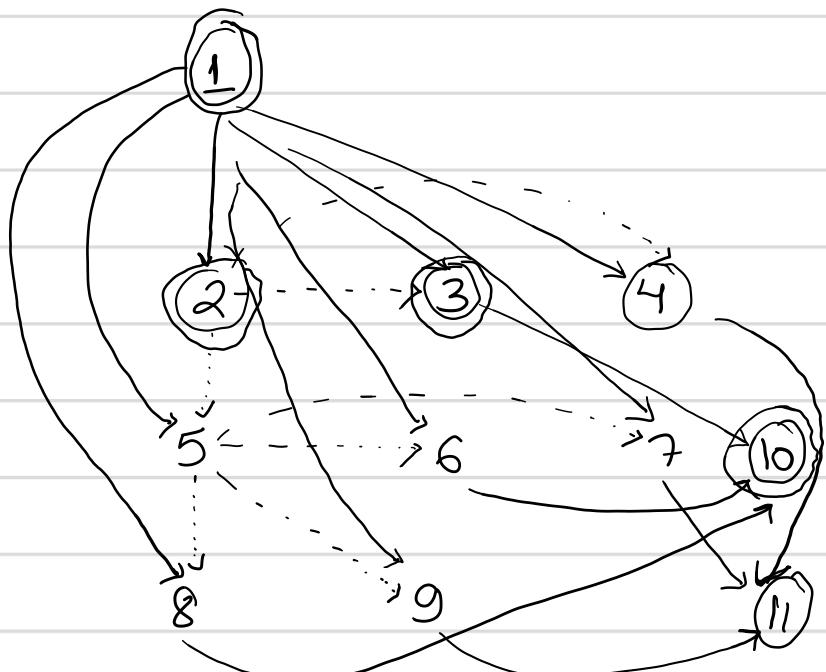

```
9     y = n+5
10    z = n+6
11 print(y)
12 print(z)
```

Input = -1

History : 1, 2, 3, 4, 10, 11

PDG:

①  $\rightarrow$  executed

slice ( $10, \{y\}$ )  
⇒  $\{1, 2, 3, 10\}$ .

Lizna

Consider the code

$n = \text{input}()$

$z = 0$

$y = 0$

$i = 1$

while  $i < n :$

$z = z + y$

$y = y + 1$

$i = i + 1$

$\text{print}(z)$

for  $n = 1$

Q1. Use method discussed  
in the lecture. Discuss  
the limitation.

Q2. Is there more  
accurate method?

Explain.

Random Testing & Fuzzing :-

- ① Black Box
- ② Grey Box
- ③ White Box.
